

LPG SOLUTIONS

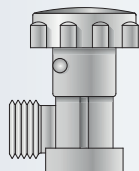

LPG CAPS-SEALS

Lagoplast caps and seals are manufactured with materials that allow high resistance to ultra violets and shocks, even at low temperatures.

These materials assure impermeability and resistance to LPG, but also the possibility to produce caps and seals in many colours and embossed with logos or inscriptions.

All caps and seals are submitted to tightness tests, endurance tests in surface-active agent and artificial ageing tests with UV lamp.

Caps and seals can be studied and produced on request, according to different dimensions, colours and operation requirements.

LPG INDICATOR PLATES

Plates and rings for cylinders are produced in polyamide, a guarantee of long-lasting, and are used to carry important inscriptions as required by LPG National Standards.

Plates and rings are produced by plastic injection and, according to the customer's requirements, they may indicate the re-testing year, the company's data, and some other instructions.

The rings can also be written with the necessary information through pad printing, thus increasing writing options, even with color.

LPG TANK ACCESSORIES

A wide range of lpg tank accessories is available in order to meet the requirements coming from the most important lpg companies in the last years.

Lagoplast produces

- signal pickets for underground lpg tanks
- valve seals
- valve caps
- indicator plates for the valve tare
- protection seals for tanks valve.

 **Lagoplast**

The protection seals AP01100 are conceived as a coded system of sealing which insures the lpg filling operations. They guarantee against tampering and protect from dirt and bad weather. Each company is furnished with coded locks and the seals can be also personalised with the company logo.

LPG CLIP-ON REGULATORS

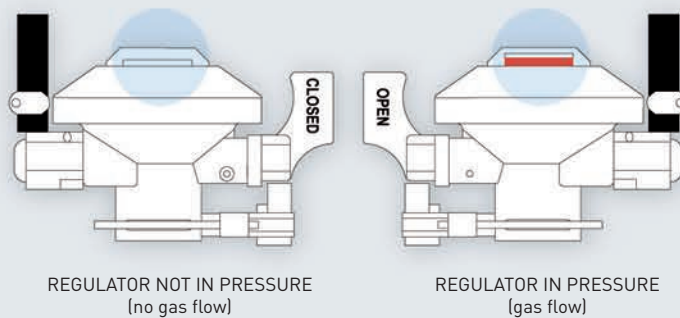

Since 1970, LAGOPLAST has been transferring its experience in plastic injection to the safety requirements for LPG equipment, producing a wide range of LPG pressure regulators for domestic use, in resin, provided with unique features and tested one by one. The original clip-on coupling allows a simple and safe connection only when the gas opening knob is in the “closed” position. All LAGOPLAST regulators can be equipped with revolving hose nozzle and with a signaling system showing that the regulator is in pressure.

LPG SAFETY

All Lagoplast regulators are made of THERMOPLASTIC RESIN, which is itself a fundamental safety characteristic. In fact, in case of fire at the valve connection, the resin body of the regulator, because of the heat, loses its original shape, allowing the closure of the valve and stopping the gas flow in about a minute. We call it “the fuse effect”. All Lagoplast regulators meet the European Standard EN 16129 and, upon request, they can be equipped with additional safety devices such as the excess flow valve and the under pressure shut off device.

LPG INTELLIGENT

Lagoplast regulators can be equipped with two distinctive characteristics:

- a visual indicator signals to the user if the regulator is in pressure. This visual indicator can also advise of possible leakages in the equipment.
- a revolving hose nozzle avoids dangerous curves of the connected flexible pipe.
